

Millicent Adhiambo Odhiambo

+254768035007 | [Email](#) | [GitHub](#) | [LinkedIn](#)

Software Developer focused on building practical, user-centered software solutions through project-based and collaborative development. Experienced with Go, JavaScript, React, Python, REST APIs, SQL, Linux, and Git. Interested in backend development, full-stack applications, fintech, and technology-driven solutions to real-world problems. I enjoy learning through building, collaborating with other developers, and turning ideas into working software.

Tech Stack

Backend: Go, REST APIs, Python, SQL, SQLite, PostgreSQL

Frontend: HTML, CSS, JavaScript, React

Tools & Platforms: Git, GitHub, Linux, Docker, VS Code

Projects

Idinex — *Go • REST API • Vanilla JavaScript (ES Modules) • Authentication(building)* [link](#)

- A collaborative idea-cataloguing platform where users can submit, browse, and refine ideas together.
- Built a Go backend with a full CRUD ideas service and an auth service layer handling registration, login, and session logic.
- Implemented the frontend with vanilla JavaScript ES modules, including form validation, a password strength meter, and dynamic UI feedback.

Bionode — *Python (FastAPI) • React/TypeScript • Redis • IoT Telemetry* [link](#)

- An IoT-based flood and water-pollution early-warning system built at the Kijani Hackathon, using a "KijaniBox" sensor device to stream live water-level and turbidity readings.
- Built a FastAPI backend implementing flood-control logic (automated diversion-valve triggers with hysteresis) and pollution-spike detection, with Redis-backed alert queuing and Server-Sent Events for real-time streaming.
- Designed the data layer with SQLAlchemy models for sensor logs and alert history, plus a satellite soil-saturation integration; built the dashboard frontend with React, TypeScript, and Tailwind CSS.

Care for the Future Integrated Project (CFTFIP) — *HTML • CSS • JavaScript* [link](#)

- A web project developed to provide a digital platform for communicating information and services through a structured online interface.
- Implemented the frontend using semantic HTML, CSS styling, JavaScript interactions, navigation, and responsive page organization.
- Demonstrates practical frontend development, UI implementation, website structure, and translating project requirements into a functional web experience.

AfriPay — *Go • Bitcoin Lightning • APIs | Group Project* [link](#)

- A collaborative fintech project exploring faster and lower-cost cross-border payments for African businesses and traders.
- Explored Bitcoin Lightning-based payment flows, local-currency conversion, fraud detection, and business analytics.
- Developed as a group project, demonstrating teamwork, Git/GitHub collaboration, problem-solving, and building technology around a real-world financial challenge.

Education

Diploma in ICT (DICT) — Masinde Muliro university

Software Development Training — Zone01 Kisumu

Peer-to-peer, project-based software development
